Abstract An annotated checklist of marine and freshwater fish species of the Koshiki Islands and adjacent waters, Kagoshima, southern Japan, was compiled from voucher specimen and literature surveys. A total of 817 species (204 families) are listed, together with literature citations, specimen registration numbers, sizes and collection localities, and remarks where applicable. First specimen-supported records from the islands included 353 species. The Koshiki Islands represent the southernmost distribution of four temperate species [*Gymnogobius heptacanthus* (Hilgendorf, 1879), *Luciogobius* sp. 3 sensu Shibukawa et al. (2019) “Goma-mimizu-haze”, *Clidoderma asperrium* (Temminck & Schlegel, 1846), and *Eopsetta grigorjewi* (Herzenstein, 1890)] and northernmost distribution of five species [*Congriscus maldivensis* (Norman, 1939), *Solegnathus (Solegnathus) lettiensis* Bleeker, 1860, *Hipposcarus longiceps* (Valenciennes, 1840), *Labracinus ocelliferus* (Fowler, 1946), and *Coelorinchus fuscigulus* Iwamoto, Ho & Shao, 2009].

Koreeda, R. and H. Motomura. 2025. An annotated checklist of marine and freshwater fishes of the Koshiki Islands and adjacent waters, Kagoshima, southern Japan, with 353 new records. Bulletin of the Kagoshima University Museum, 21: 1–119.

Introduction

The Koshiki Islands are located in the East China Sea, ca. 40 km west of the Satsuma Peninsula on the Kagoshima mainland, Kagoshima Prefecture, Kyushu, Japan. They comprise three major islands, Kamikoshiki-shima, Nakakoshiki-shima, and Shimokoshiki-shima islands, in addition to several smaller islets. The waters surrounding the islands include both shallow and deep (about 300–400 m) areas, and are well-known as fishing grounds for Silver-stripe Round Herring (*Kibinago*) *Spratelloides gracilis* (Temminck & Schlegel 1846) and Jack-knife Shrimp *Haliporoides sibogae* (de Man 1907), the latter being well-known in Kagoshima Prefecture as Takaebi. Because bottom trawling for “Takaebi” provides many opportunities for collecting deep-sea fishes as bycatch, part of the deep-sea fish fauna around the Koshiki Islands has already been recorded (e.g., Fukui et al., 2015; Nakamura et al., 2020, 2021; Nakayama, 2020). In addition, fish-resource surveys by public institutions have also been conducted around the islands (e.g., Kitajima et al., 1976; Yamada et al., 1986, 2007), as well as longline and line fishing in deeper areas (Nakamura and Motomura, 2021). The deep water Splendid Lanternshark *Etmopterus splendidus* Yano, 1988 was described from a specimen taken off Shimokoshiki-shima island by line fishing at 210 m depth. On the other hand, surveys of the coastal ichthyofauna have been limited. Imai (1974) studied the ichthyofauna of Shimokoshiki-shima island and reported 125 species (re-determined herein) as a species list. Unfortunately, that species list, including both Japanese and scientific names, is now somewhat outdated. Kagoshima City Aquarium Foundation (2008, 2018) reported 59 species collected by set net at the southwestern part of Shimokoshiki-shima island, but did not indicate if voucher specimens were retained. Freshwater and brackish fishes, surveyed up to the 2000s, are relatively few, the islands lacking large rivers (Hayashi, 1976; Kakimoto, 1979; Ike, 1999; Mukai, 2001; Matsunuma et al., 2010). However, recent surveys of fishes in vulnerable terrestrial waters in the Koshiki Islands are limited.

A comprehensive long-term survey of the ichthyofauna of the Koshiki Islands has been conducted since 2008 by the Laboratory of Fish Systematics, the Kagoshima University Museum (KAUM), in collaboration with Kindai University (KUN). As a result, 661 species, including 3,635 specimens, have been collected from the Koshiki Islands and adjacent waters up to December 2024. Based on literature surveys, 304 species have been recorded so far from the Koshiki Islands and adjacent waters. All fishes formerly recorded, and collected from the Koshiki Islands and adjacent waters in the above survey, are listed in here.

Material and methods

Fish specimens were collected using SCUBA or by snorkeling with sampling gear (e.g., hand net), line fishing from the coast or from boats, casting net, hand net and by hand. Some specimens were purchased from or gifted at the fish landing ports on the Koshiki Islands, Kagoshima Central Fish Market, and local supermarkets (Koshiki Islands and Kagoshima City). Curatorial procedures for newly collected specimens followed Motomura and Ishikawa (2013). Standard length, total length, and disk width are abbreviated as SL, TL, and DW, respectively. The systematic arrangement of families generally follows Nelson (2006). Scientific names generally follow Fricke et al. (2023), with some modifications following Motomura (2025) or recent taxonomic studies. Within families, species are arranged in alphabetical order of scientific names. Standard Japanese names generally follow Motomura (2025), having been transliterated using the Hepburn system. Each species record was compiled from voucher specimens and/or published literature. Registration number, number of specimens registered (if more than one), mm in SL, TL, or DW, and collection locality (Fig. 1) in the Koshiki Islands [Kamikoshiki-shima island (KK), Nakakoshiki-shima island (NK), and Shimokoshiki-shima island (SK)] and adjacent waters are listed in each species record. Some specimens in KAUM, having been collected from the intermediate area between the Koshiki Islands and Goto Islands (details unknown), are included here as “north of Koshiki Islands”. In addition, bottom-trawled specimens landed at Nomaike Fishing Port are included as “east of Koshiki Islands” or “south of Koshiki Islands”. Institutional codes follow Sabaj (2020).

Remarks

Species numbers in each family represented by more than 10 species at the Koshiki Islands are shown in Table 1. In Japanese waters, the ichthyofauna differs between the Nansei Islands (Yaku-shima island, Osumi Islands to the Yaeyama Islands), and the Pacific coast of the southern Japanese mainland to the Ogasawara Islands and Tanega-shima island (Osumi Islands) (Motomura, 2012; Motomura and Matsunuma, 2022). This biogeographical boundary between Yaku-shima and Tanega-shima islands, referred to as the “Osumi Line”, is considered to be maintained by the Kuroshio Current (Motomura and Harazaki, 2017; Motomura and Matsunuma, 2022; Motomura, 2023). The three most speciose families in the former region include Gobiidae, Labridae, and Pomacentridae, compared with Gobiidae, Labridae, and Serranidae in the latter region (Motomura, 2023). The ichthyofauna of the Koshiki Islands is similar to that of the former region. Carangidae, the fourth most speciose family at the Koshiki Islands, is a “top 10” most speciose family in only a few southern Japanese mainland/Ogasawara Islands localities. Lutjanidae, the seventh most speciose family at the Koshiki Islands, is one of the “top 10” families at Tanega-shima and Mage-shima islands (adjacent to the Osumi Line), and the Ogasawara Islands (Motomura, 2023). Therefore, the ichthyofauna of the Koshiki Islands is considered to be similar to the southern Japan mainland/Ogasawara Islands region, including Tanega-shima island, especially in the warm low latitudes of the latter. Although the present rankings are similar to those resulting from previous studies, which focused on coastal shallow marine fishes, the former differs in including deep-sea fishes (e.g., Macrouridae is ranked as the ninth most speciose family).

Of the 817 species previously recognized from the Koshiki Islands and adjacent waters, 154 were not recorded during the present survey of KAUM and KUN specimens, being only literature records. A major concern is the non-finding in recent years of some fresh and brackish water species, recorded in the earlier literature and survey of coastal fishes by Imai et al. (1974), although the earlier records may include some misidentifications. Of the 17 fresh or brackish water species recorded prior and up to the 2000's, however, the following species have not been recently recorded (Ogawa, 1937; Dôtu, 1957, 1958; Dôtu and Fujita, 1959; Hayashi, 1976; Kakimoto, 1979; Ike, 1995; Matsunuma et al., 2010): *Carassius* sp. “Gimbuna”, *Cyprinus carpio* Linnaeus, 1758, *Misgurnus anguillicaudatus* (Cantor, 1842), *Plecoglossus altivelis altivelis* (Temminck & Schlegel, 1846), *Gambusia affinis* (Baird & Girard, 1853), *Eleotris fusca* (Bloch & Schneider, 1801), *Eleotris melanosoma* Bleeker, 1853, *Eleotris oxycephala* Temminck & Schlegel, 1845, *Gymnogobius heptacanthus* (Hilgendorf, 1879), *Gymnogobius urotaenia* (Hilgendorf, 1879), *Luciogobius guttatus* Gill, 1859, *Oxyurichthys ophthalmonema* (Bleeker, 1856), *Pandaka* sp. “Gomahaze”, *Pseudogobius masago* (Tomiyama, 1936), *Redigobius bikolanus* (Herre, 1927), *Rhinogobius fluviatilis* Tanaka, 1925, *Stenogobius* sp. “Tanekawahaze”. Although further studies of the four estuarine lakes on Kamikoshiki-shima island (Namako Pond; Kai Pond; Kuwazaki Pond; and Suguchi Pond) may disclose some additional species, the fresh and brackish water environments in the Koshiki Islands appear to have deteriorated in recent years. A second discrepancy in species recorded is seen in Imai et al.'s (1974) report of 125 species from the coastal areas of the islands by diving surveys, 48 of these not having been recorded by the more recent studies, in particular, 12 and 10 spe-

cies, respectively, of Chaetodontidae and Labridae. Although sampling fast-swimming members of these two families may be difficult, such does not fully explain such a discrepancy. Changes in the marine environment may be a factor.

The Koshiki Islands represent the southernmost distribution of four temperate species [*Gymnogobius hepaticanthus* (Hilgendorf, 1879), *Luciogobius* sp. 3 sensu Shibukawa et al. (2019) “Goma-mimizu-haze”, *Cliderma asperrimum* (Temminck & Schlegel, 1846), and *Eopsetta grigorjewi* (Herzenstein, 1890) (Matsunuma et al., 2010; Ohashi and Motomomura, 2011; Koreeda and Motomura, 2021b; this study)], and northernmost distribution off five species [*Congrus maldivensis* (Norman, 1939), *Solegnathus* (*Solegnathus*) *lettiensis* Bleeker, 1860, *Hipposcarus longiceps* (Valenciennes, 1840), *Labracinus ocelliferus* (Fowler, 1946), and *Coelorinchus fuscigulus* Iwamoto, Ho & Shao, 2009 (Imai, 1974; Koeda and Motomura, 2016; Nakayama, 2020; Mochizuki et al., 2022; Yuki et al., 2023)]. However, it should be noted that the record of *Labracinus ocelliferus* is not based on a voucher specimen (Imai, 1974).

FAMILY POMACENTRIDAE

Chromis albicauda Allen & Erdmann, 2009

[Jpn name: Koganesuzumedai]

Imai et al. (1974): SK. This study: KAUM-I. 147437, 31.6 mm SL, east of Kashima, Shimokoshiki, SK.

Remarks: Imai et al. (1974) listed Chromis analis as “Ogonsuzumedai”. However, the relationship between Chromis analis and C. albicauda in Japan has been confused until Iwatsubo and Motomura (2010) was published. As the record of Imai et al. (1974) is only a species list, the present identification of “Ogonsuzumedai” is provisional.

***Clariger exilis* Snyder, 1911**

[Jpn name: Shimofurisejirohaze]

This study: KAUM-I. 147578, 22.4 mm SL, east coast of Teuchi Bay, Teuchi, Shimokoshiki, SK.

Remarks: Shiogaki and Dotsu (1972) reported a single specimen (13.0 mm TL) as *Clariger cosmurus* from Segawa, Kamikoshiki-shima island. They recognized three morphotypes in *C. cosmurus* from over 60 specimens from Kyushu and Kamikoshiki-shima island. Three morphotypes defined by Shiogaki and Dotsu (1972) have currently been recognized as *Clariger cosmurus* Jordan & Snyder, 1901, *Clariger exilis* Snyder, 1911, and *Clariger* sp. "Shirohige-sejirohaze", respectively (Akihito et al., 2013; Shibukawa et al., 2020). Shiogaki and Dotsu (1972) however did not mention which morphotype was from Kamikoshiki-shima island. Only a few individuals of *Clariger exilis* were found during our field surveys at Shimokoshiki-shima island.

Remarks: Nagata (1993) reported *Favonigobius gymnauchen* from Kamikoshiki-shima island. This record was based on three specimens, but one of them was re-identified as *F. reichei* (see Ike, 1995).

***Favonigobius reichei* (Bleeker, 1854)**

[Jpn name: Minamihimehaze]

Nagata (1993): KK. Ike (1995): KK.

Remarks: Previous records of *F. reichei* often included other species, especially *Favonigobius* sp. D sensu Momose (2024) (Koreeda et al., 2024; Momose, 2024). Hayashi (1995) reported five specimens as *F. reichei* from Kamikoshiki-shima island, and his identification is tentatively followed in this study.

[Jpn name: Oyoshinobori]

Kakimoto (1979): KK.

Remarks: Kakimoto (1979) reported many individuals of “Yoshinobori Kokushoku Ogata” from Shimokoshiki-shima island. This name has currently applied to *Rhinogobius fluviatilis*. However, in members of Rhinogobius, only *R. brunneus* and *R. similis* were observed from freshwater areas on the Koshiki Islands by our recent surveys.

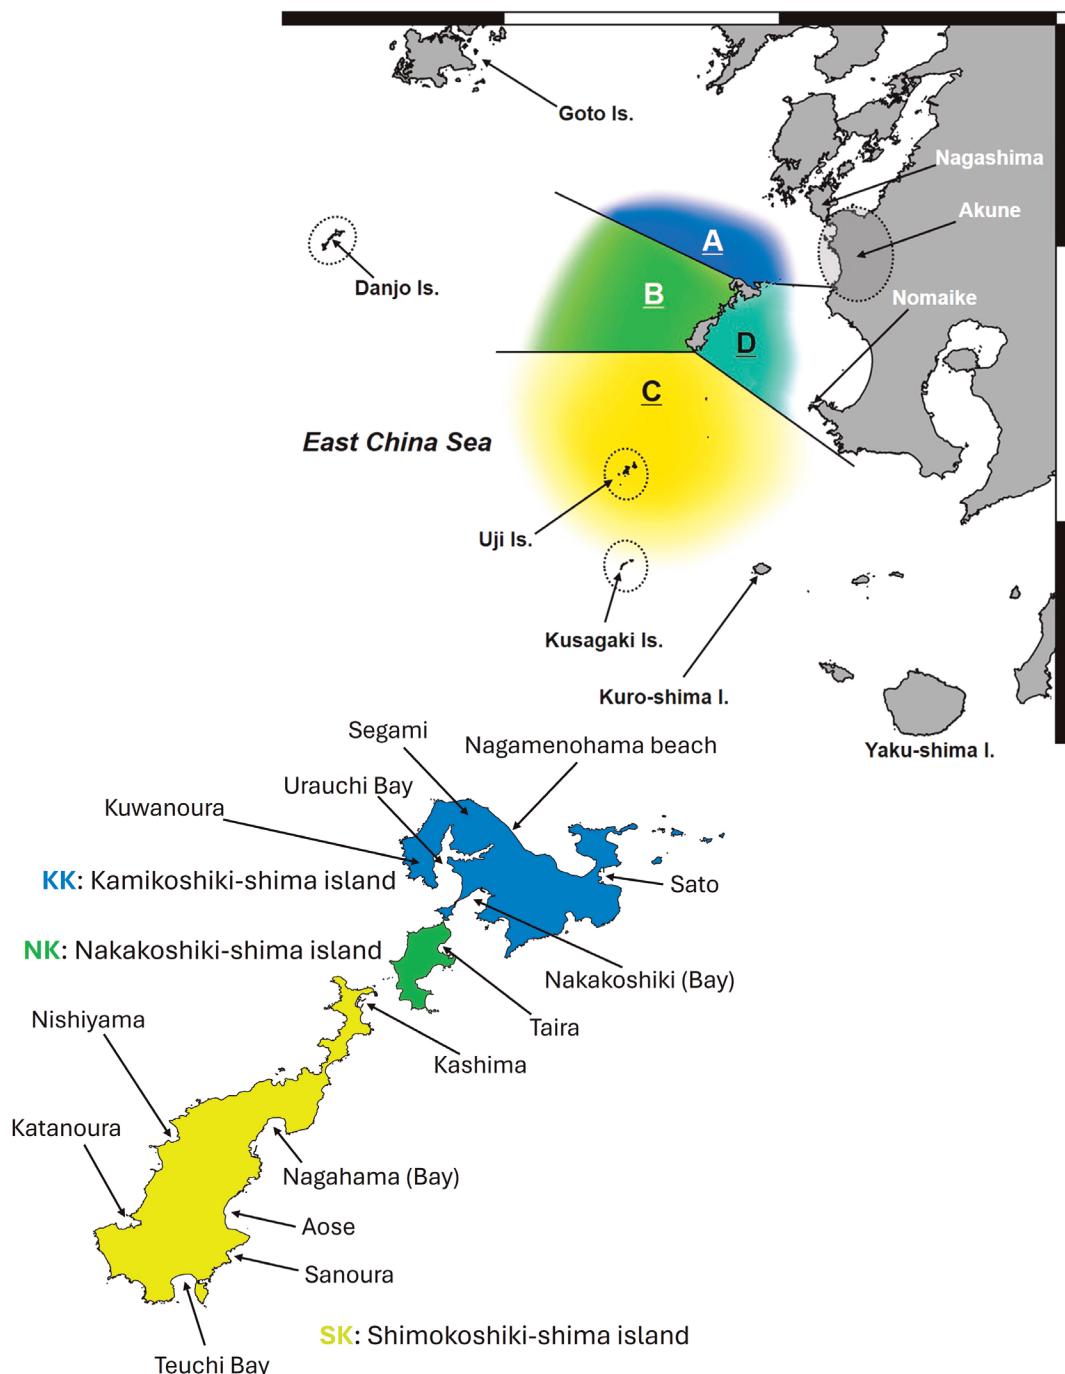

Fig. 1. Maps of the Koshiki Islands and adjacent waters. A, B, C, and D indicate the names of abbreviated collection sites for north off Koshiki Islands, west of Koshiki Islands, south off Koshiki Islands, and east off Koshiki Islands, respectively.

A total of 817 species, including 353 species that represent the first reliable records from the Koshiki Islands and adjacent waters on the basis of collected specimens and/or underwater photographs, are listed with citation of literature, registration numbers, sizes, localities on the island, and some remarks.
